

EXPERIMENT NO.: 17

TITLE: Creating, Containerizing and Deploying a Python Flask API Using Docker and Kubernetes

AIM: To create a simple Python Flask API, containerize it using Docker, build and push the image to Docker Hub, and deploy the application on Kubernetes using Deployment and Service manifests.

OUTPUT:

RESULT: The Flask API was successfully created, containerized, built and pushed to Docker Hub. The application was deployed successfully on Kubernetes using Deployment and Service YAML files and accessed through a NodePort service.
