

EXPERIMENT NO.: 16

TITLE: Creating, Containerizing, Building and Serving a Static Website Using Docker

AIM: To create a simple static website, containerize it using Docker with an Nginx server, build a Docker image, run the container, and access the website through a web browser.

OUTPUT:

RESULT: The static website was successfully created, containerized using Docker and Nginx, built into a Docker image, and served through a running container. The website was accessed successfully using a web browser.
